ProAnalyst Labs

AI-driven tactical simulation for coaches and analysts

Who We Are
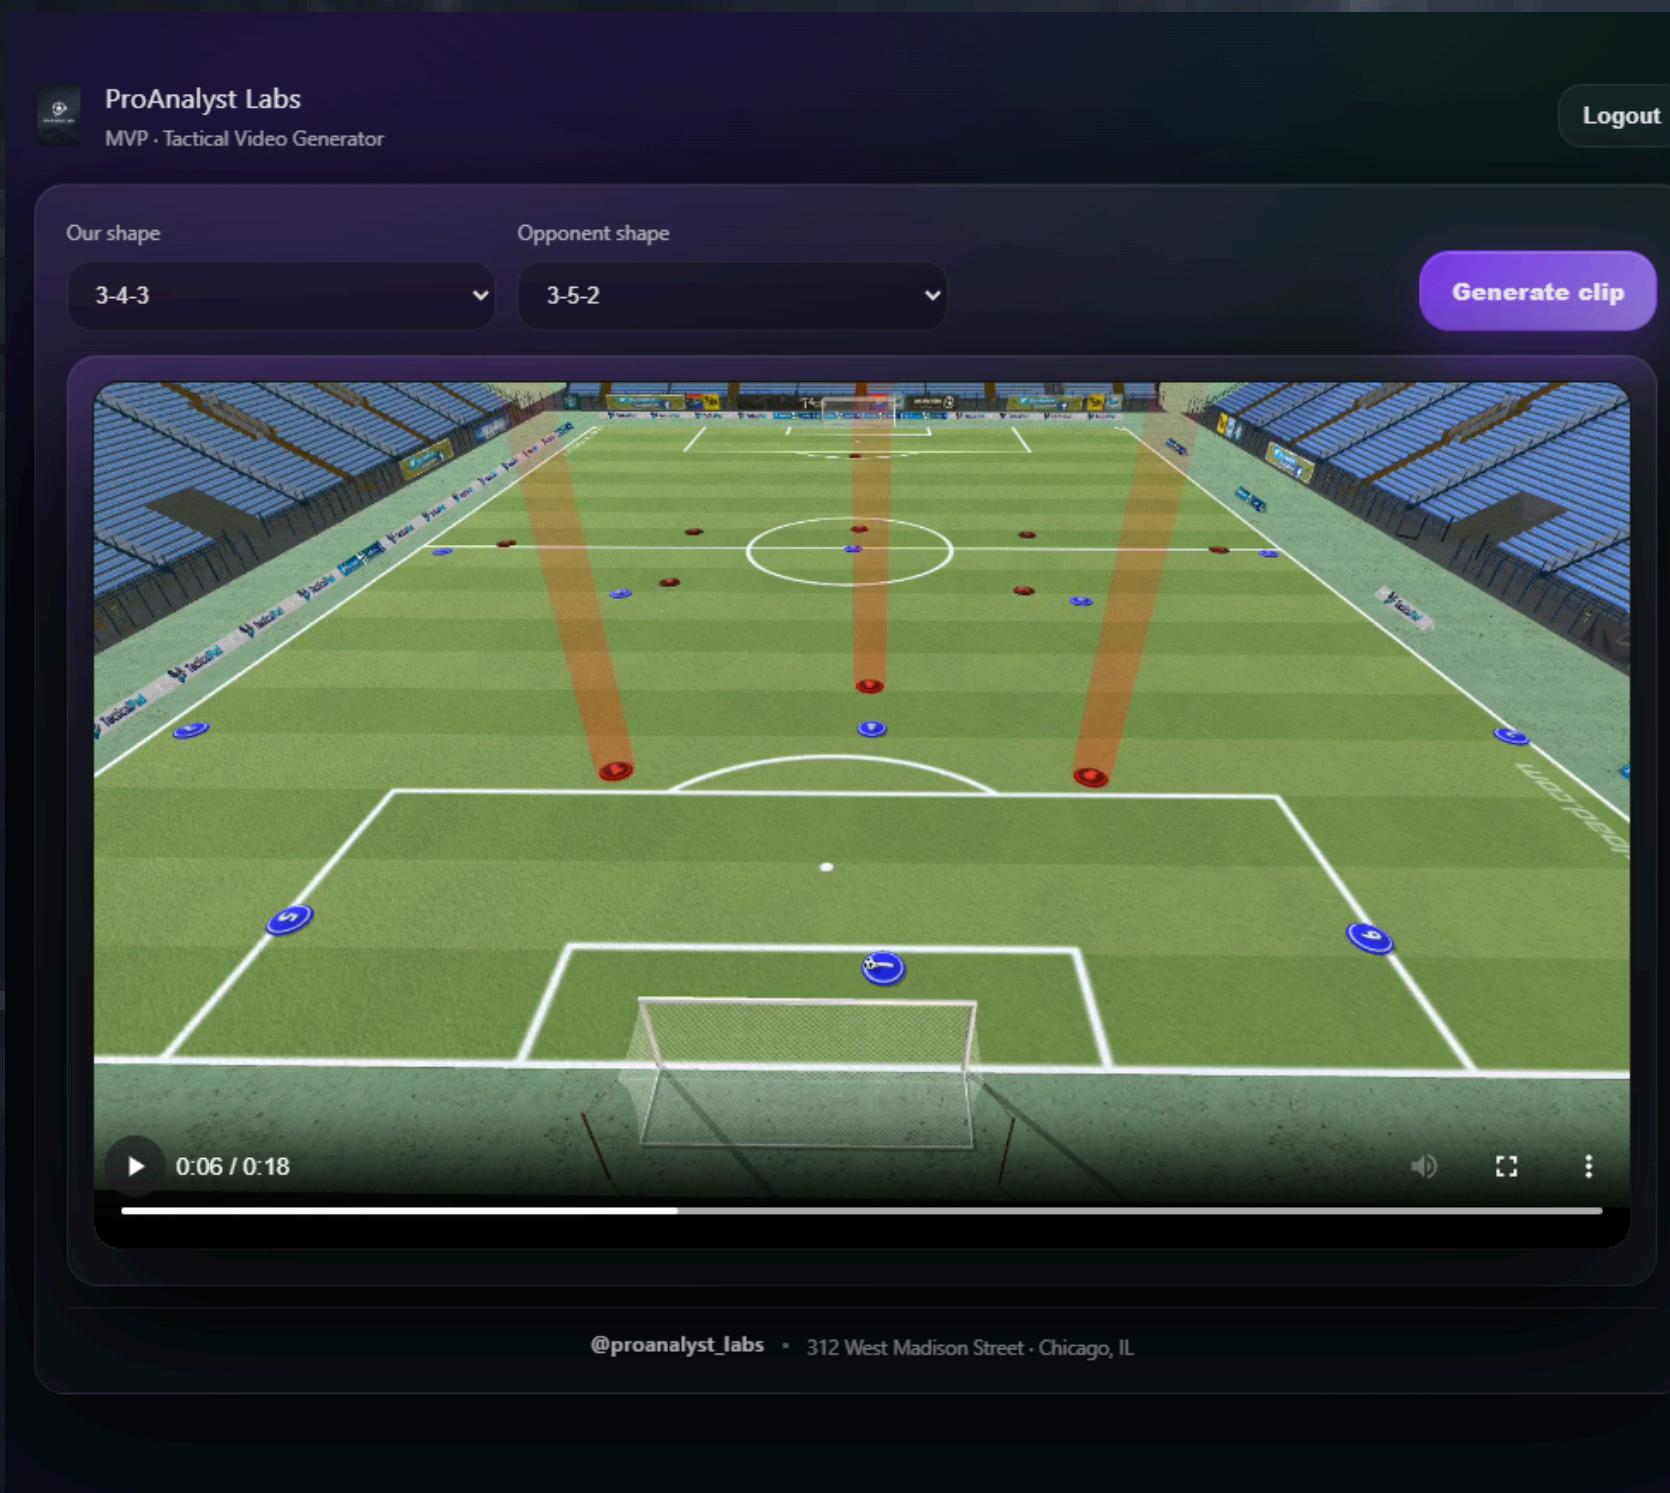

ProAnalyst Labs is an AI-driven football analysis project focused on tactical simulation and decision support.

We collaborate with coaches, analysts and technical staff to translate tactical concepts into structured, measurable models.

Our work combines match analysis methodology with modern AI engineering to accelerate preparation and tactical clarity.

What We Do

We provide a web platform delivering 3D tactical scenarios designed for real coaching workflows.
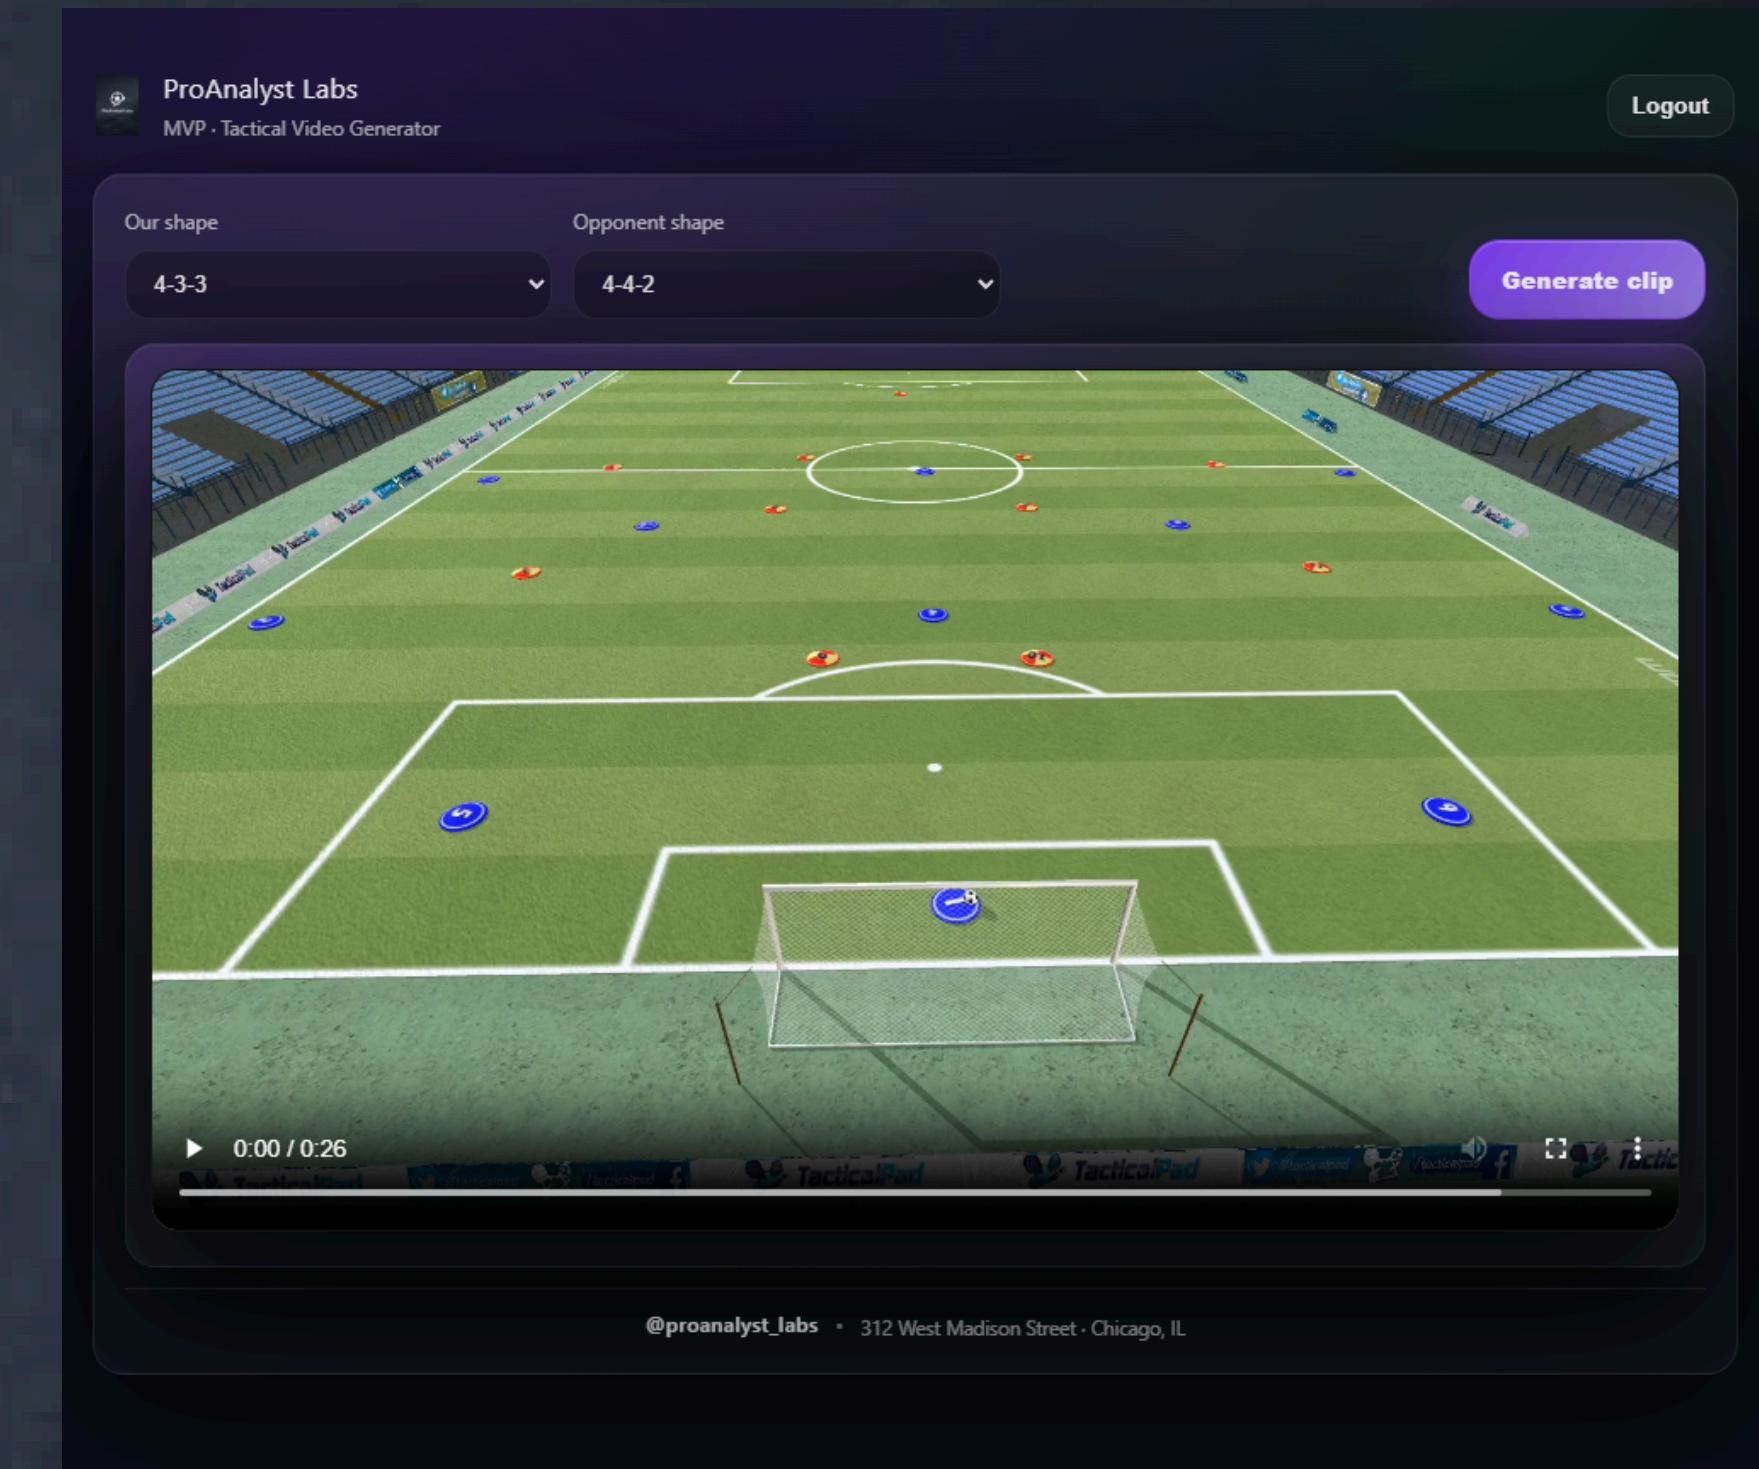

The product helps staff explore tactical solutions such as:
Pressing patterns
Build-up against different structures
Superiority creation and space exploitation
Tactical positioning and spatial density

Our Vision

We are building a tactical engine that can generate scenarios on demand:

User request → AI tactical plan → simulation → 3D video output.

Current Stage

ProAnalyst Labs is currently in MVP v1, live in production.

The platform serves a deterministic library of 9 tactical 3D videos, mapped to formation match-ups.

We are currently validating usefulness with professional and amateur technical staff, collecting feedback to guide the roadmap toward AI-generated videos.
